Message from the Guest Editor

Dear Colleagues,

One of the major types of epigenetic factors is the large family of ATP-dependent chromatin remodeling complexes that reorganize chromatin by moving nucleosomes on DNA, disassembling and reassembling nucleosomes, or dynamically exchanging into chromatin different histone variants such as histone H2A.Z. Recent advances in high resolution cryo-electron microscopy have provided critical insights into the mechanisms of chromatin remodeling that also complement biochemical approaches used for this purpose. Advances in genomics/next generation DNA sequencing and molecular genetics has revealed that these chromatin remodelers are important in development and differentiation and when mutated can become the molecular basis for several diseases including cancer. In this issue, we will examine the convergence of these two distinct areas and how they inform us as to the importance and roles of these factors for regulating the epigenome and its impact on human diseases.

Message from the Editorial Board

A major strength of biological science is the diversity of approaches that biological scientists apply to their research problems. *Biology* reflects this diversity and brings together studies employing the varied experimental and theoretical approaches that are fueling biological discovery. *Biology*, the journal, is a fully peer-reviewed publication with a rapid and economical route to open access publication and is listed on PubMed. All articles are peer-reviewed and the editorial focus is on determining that the work is scientifically sound rather than trying to predict its future impact.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, PubAg, CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (*Biology*) / CiteScore - Q1 (*General Agricultural and Biological Sciences*)
