Borderline personality disorder (BPD) is a complex disorder with large inter-individual variability in symptom profiles, which may include impaired relatedness, affective dysregulation, and behavior dysregulation. The problematic nature of BPD is characterized by self-mutilation, suicide attempts, addictions, and episodes of depression, anxiety, and aggression, which produce substantial healthcare-related and social-related costs. Psychotherapy is considered the primary treatment for BPD, and this is effective in reducing overall borderline personality disorder severity. Affective neurosciences have shown functional impairment associated with BPD in the default mode network (DMN), the salience network (SN), and the central executive network (CEN), accounting for disturbances in emotion regulation, social cognition, and all emotion-related functions. The scope of this Special Issue is to provide a venue for the dissemination of research findings from the study of brain mechanisms in BPD and its treatment, including studies focused on concepts that may have clinical implications for the treatment of BPD.

an Open Access Journal by MDPI

Pittsburgh, PA 15260, USA

Message from the Editor-in-Chief

You are invited to contribute a research article or a comprehensive review for consideration and publication in *Brain Sciences* (ISSN 2076-3425). *Brain Sciences* is an open access, peer-reviewed scientific journal that publishes original articles, critical reviews, research notes, and short communications on neuroscience. The scientific community and the general public can access the content free of charge as soon as it is published.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, PSYINDEX, PsycInfo, CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q2 (Clinical Neurology) / CiteScore - Q2 (General Neuroscience)
