

## Cold-Formed Steel Structures

Guest Editor:

**Dr. Krishanu Roy**

Civil Engineering, The University  
of Waikato, Hamilton 3240, New  
Zealand

Deadline for manuscript  
submissions:

**30 November 2025**

### Message from the Guest Editor

Dear Colleagues,

Cold-formed steel (CFS) members are made from structural quality sheet steel that are formed into C-sections and other shapes by roll forming the steel through a series of dies. CFS structures are however susceptible to different buckling failures, which can cause significant damages to CFS structures. Therefore, Dr Roy warmly invites authors to submit their papers for potential inclusion in this Special Issue of “Cold-formed steel structures”, on themes that may include but are not limited to:

- High strength CFS structures
- Stability of CFS beams and columns
- Seismic response of CFS structures
- CFS portal frames
- Web crippling of CFS sections
- Fire and seismic performance of CFS framed shear walls
- Hysteretic behaviour of CFS wall panels
- Fire furnace tests on CFS members
- Cold-formed stainless steel sections
- CFS cladding systems
- Sustainability of CFS structures

## Editor-in-Chief

### Prof. Dr. David Ardit

Construction Engineering and  
Management Program,  
Department of Civil,  
Architectural, and Environmental  
Engineering, Illinois Institute of  
Technology, 3201 South  
Dearborn Street, Chicago, IL  
60616, USA

## Author Benefits

**Open Access:** free for readers, with no direct environmental charges (Article Processing Charge) and technology that can bring dramatic improvements to design, planning, and policy (we critically analyze, develop the cities and buildings of the future).

**High Visibility:** indexed with peer-reviewed journals, and other databases.

**Journal Rank:** JCR - Q2 (Construction and Building Technology) / CiteScore - Q1 (Architecture)

## Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovation and technology can bring dramatic improvements to design, planning, and policy (we critically analyze, develop the cities and buildings of the future).
