Message from the Guest Editor

The objective of this Special Issue is to bring together the most recent research regarding the above-mentioned problem, to support the increasing needs of both academia and industry, including experimental testing, numerical calculation, design strategies, serviceability assessments, and their engineering applications. On 18-20 June 2021, we hosted “The 1st National Conference on Vibration Comfort of Engineering Structures” in Shanghai. This Special Issue is an outcome of that conference.

Topics may include, but are not limited to:

- Dynamic load models for serviceability problems;
- Analytical methods for structural response calculation;
- Experimental tests for serviceability assessment;
- New technologies for vibration control;
- Serviceability evaluation criteria;
- Design strategies of serviceability and applications;
- Inverse problems in vibration serviceability;
- Serviceability of specific structural type (RC, SRC, wood, etc.);
- Big-data analysis in vibration serviceability.

For scholars interested to submit papers to the Special Issue, please click “Submit to Special Issue” or contact Astoria Yao: astoria.yao@mdpi.com.

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city’s operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.
