

Special Issue

Fibre-Reinforced Polymer Composites in Civil Engineering

Message from the Guest Editors

The retrofitting of civil engineering structures is essential for creating a sustainable built environment. Structural engineers are challenged with assessing the vulnerability of deteriorated or damaged structures and deciding on the appropriate retrofit methods. Fiber-reinforced polymer (FRP), a non-metallic composite, is considered a novel and promising material and an alternative to traditional materials. Authors are invited to submit high-quality research or review articles on the topics including, but not limited to:

- Fibre-reinforced polymer (FRP) composites for structural applications;
- (FRP) composites for building blast protection;
- Buildings, bridges, pipelines, and other civil infrastructures made of (FRP) composite;
- Analysis of the growth of fatigue cracks in (FRP) composites;
- Retrofitting, repairing, and strengthening structural elements with (FRP) composites;
- Non-destructive evaluation of structural elements made with (FRP) composites;
- Finite element analysis, artificial neural networks, and other machine learning techniques for FRP composite civil engineering materials;

About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) /
CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 14.9 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
