Research on Mechanical Properties of Cement-Based Composites

Message from the Guest Editors

The mechanical properties of materials determine their applications in construction engineering. In order to address the limited applications of ordinary cement-based materials due to poor toughness, high brittleness, and low tensile strength, cement-based composites are gaining more and more attention. Given that cement-based materials are usually used in harsh environments, durability is considered an important performance indicator. Meanwhile, to maintain human health and protect the environment, developing sustainable building materials is also necessary. This Special Issue aims to collect the latest research on cement-based composites, explore new chemical and mineral additives to modify cement, and expand the production and application of such materials. The research areas may include but are not limited to the following:

- ecological cement;
- functional cement;
- ultra-high-performance concrete;
- durability of concrete;
- CO₂-cured concrete;
- reinforced concrete;
- fiber concrete.

About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Editor-in-Chief

Prof. Dr. David Arditi

Construction Engineering and Management Program, Department of Civil, Architectural, and Environmental Engineering, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL 60616, USA

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) /
CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.1 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the second half of 2025).
