Special Issue

Advanced Technologies for Successful and Sustainable Construction and Maintenance Projects—2nd Edition

Message from the Guest Editor

What constitutes a successful project? The recent debate on this question refutes the well-known “iron triangle” to include factors other than cost, time, and quality. Similarly, the environmental concerns of recent decades have asked the question, what is a sustainable project? It is well known that factors significantly contributing to climate change and global warming during construction include increased levels of carbon emissions and other atmospheric pollutants, waste generation, and natural resource consumption. Therefore, construction projects that have the least detrimental effect on the environment can be considered sustainable. These can be projects that encompass environmentally friendly construction materials and techniques during their initial construction, as well as ecological retrofitting methods and materials during operation. This Special Issue aims at showcasing recent academic and industrial developments for successful and sustainable project management through the whole life cycle of construction projects.

About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Editor-in-Chief

Prof. Dr. David Arditi
Construction Engineering and Management Program, Department of Civil, Architectural, and Environmental Engineering, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL 60616, USA

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) / CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 14.9 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
