

Special Issue

Climate Change and Building Energy Efficiency

Message from the Guest Editors

The building sectors are estimated to be responsible for 30–40% of the total global energy consumption and 20% of the global greenhouse gas emissions; therefore, improving the energy efficiency of infrastructure is critical to solving the climate crisis. Considering that building and construction assets are typically designed to last for several decades or even centuries, the resiliency of the buildings and their energy systems to climate change should be evaluated and improved. Building designs and energy-saving interventions should be reconsidered under different climate scenarios, specifically future scenarios, to evaluate the robustness of these strategies and to determine their potential risks. In this Special Issue, articles on topics such as climate change's impacts on buildings, mitigation of climate change effects on infrastructure, building energy saving and performance evaluations for future climate predictions, net-zero energy buildings, climate-resilient building and so on are of interest.

Guest Editors

Prof. Dr. Zhiyong Tian

School of Environmental Science and Engineering, Huazhong University of Science and Technology, Wuhan, China

Dr. Chang Shu

Construction Research Centre, National Research Council Canada, Ottawa, ON, Canada

About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Prof. Dr. David Arditi

Construction Engineering and Management Program, Department of Civil, Architectural, and Environmental Engineering, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL 60616, USA

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) /
CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 14.9 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
