New Technologies in Structural Health Monitoring of Buildings and Infrastructure

Message from the Guest Editors

Structural health monitoring (SHM) of buildings and infrastructure has been an exceedingly active research topic in the last decade. Civil engineering structures are one-of-a-kind structures that cannot be intentionally damaged to gain information on their behaviour when damage is present; to cope with this issue, the recent concepts of hybrid SHM and transfer learning are aimed at obtaining data corresponding to structural conditions that rarely occur (extreme environmental and operational conditions, damage) from numerical models of the structure and from similar structures where such data are available, respectively. Moreover, concerns about the impact of climate change on buildings and infrastructure have led to the integration of SHM and risk assessment technology to better identify vulnerable structures.

Therefore, this SI intends to bring together publications involving new technologies for the SHM of buildings and infrastructure, acting at all levels to highlight the current capabilities and future trends. About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Editor-in-Chief

Construction Engineering and Management Program, Department of Civil, Architectural, and Environmental Engineering, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL 60616, USA

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) /
CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.1 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the second half of 2025).
