

Special Issue

Advances in Wind Effects on Buildings

Message from the Guest Editors

In recent years, there are many notable developments of the study on wind effect analysis of buildings, including wind tunnel test techniques, CFD simulation, machine learning in wind engineering, non-Gaussian wind pressures, nonstationary wind effects, aero-elastic effects of large-span membrane and high-rise buildings, wind interference effects, equivalent static wind loading, wind-induced responses of base-isolated buildings, wind vibration control of flexible buildings, wind-induced damage analysis of cladding systems, wind-related multiple hazards for buildings, performance-based wind engineering, design wind loading for building codes, etc. To reflect the recent progress in wind effect analysis of buildings, a special issue on this topic is proposed. Original articles, case reports, and reviews in the field of wind loading and wind responses analysis of buildings are warmly welcome.

About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Editor-in-Chief

Construction Engineering and Management Program, Department of Civil, Architectural, and Environmental Engineering, Illinois Institute of Technology, 3201 South Dearborn Street, Chicago, IL 60616, USA

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) /
CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 14.9 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
