

Special Issue

Eco-Friendly Building Materials

Message from the Guest Editors

This Special Issue opens up the possibility for scientists and engineers to share their findings and views on eco-friendly building materials and low-carbon building materials. We invite researchers to share their findings on incorporating industrial, agricultural, and mining waste in building materials for structural purposes or otherwise, developing materials with lower CO₂ emissions, such as LC3 cement and alkali-activated materials, and construction artifacts with the incorporation of waste. Research on the use of mining waste, steel industry waste, biomass thermoelectric waste, construction and demolition waste in Portland cement, activated cement, mortars, and concrete is welcome. Topics of interest include, but are not limited to, the following:

- Incorporation of industrial, agricultural, and mining waste in construction materials;
- Green cement and low-carbon binders;
- Low-carbon concrete;
- Use of residues as precursors in alkali-activated materials;
- Construction and demolition waste as binders;
- Concrete artifacts incorporating waste;
- Waste immobilization in cementitious materials;
- Decarbonization via cement, mortar, and concrete.

About the Journal

Message from the Editor-in-Chief

Current urban environments are home to multi-modal transit systems, extensive energy grids, a building stock, and integrated services. Sprawling neighborhoods are composed of buildings that accommodate living and working quarters. However, it is expected that the cities and communities of the future will face complex and enormous challenges, including maintenance, interconnectivity, resilience, energy efficiency, and sustainability issues, to name but a few. A smart city uses advanced technologies and a digital infrastructure to improve the outcomes in every aspect of a city's operations. A smart building optimizes the experience of occupants, staff, and management by using a modern and connected environment. Innovations in technology that can bring dramatic improvements to design, planning, and policy are critical in developing the cities and buildings of the future.

Author Benefits

High Visibility:

indexed within SCIE (Web of Science), Scopus, Ei Compendex, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Construction and Building Technology) /
CiteScore - Q1 (Architecture)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 15.1 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the second half of 2025).
