The Tumor Microenvironment of High Grade Serous Ovarian Cancer

Message from the Guest Editors

This Special Issue focuses on high grade serous ovarian cancer (HGSOC) and the contribution of the tumor microenvironment (TME) to the unique features of this most lethal of the gynecologic malignancies and one of the most lethal of the peritoneal cancers. As HGSOC metastases have a highly complex TME, there is an urgent need to better understand the TME in general, its distinct components in particular, and the role of the TME in the context of disease recurrence and development of chemoresistance. We welcome submissions focused on the key cellular and molecular aspects of the HGSOC TME and their role in disease progression and clinical outcome.
Message from the Editor-in-Chief

Cancers is an international, online journal addressing both clinical and basic science issues related to cancer research. The journal is publishing in open access format, which will certainly evolve to ensure that the journal takes full advantage of the rapidly changing world of information and knowledge dissemination. It publishes high-quality clinical, translational, and basic science research on cancer prevention, initiation, progression, and treatment, as well as other related topics, particularly to capture the most seminal studies in the rapidly growing area of immunology, immunotherapy, and tumor microenvironment.
