Vitamin D: Role in Cancer Causation, Progression and Therapy

Message from the Guest Editor

Dear Colleagues,

Considerable environmental, ecologic, epidemiologic and laboratory data support the hypothesis that the vitamin D signaling system is important in the genesis and progression of human cancers. This hypothesis is not supported by prospective intervention trials in human populations (primarily because such trials have not been initiated), hence the hypothesis remains largely untested and the data are primarily correlative. This issue of Cancers, "Vitamin D and Cancer" seeks articles which will shed new light on this hypothesis. Careful prospective clinical studies and well controlled laboratory investigations which seek to advance the understanding of the role of vitamin D in the causation or progression of cancer are especially sought.

Cancers is an international, online journal addressing both clinical and basic science issues related to cancer research. The journal is publishing in open access format, which will certainly evolve to ensure that the journal takes full advantage of the rapidly changing world of information and knowledge dissemination. It publishes high-quality clinical, translational, and basic science research on cancer prevention, initiation, progression, and treatment, as well as other related topics, particularly to capture the most seminal studies in the rapidly growing area of immunology, immunotherapy, and tumor microenvironment.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science) and BIOSIS Previews, Scopus and other databases. Citations available in PubMed, full-text archived in PubMed Central.

CiteScore (2018 Scopus data): 5.87, which equals rank 26/321 (Q1) in 'Oncology' and rank 24/191 (Q1) in 'Cancer Research'.
