Deadline for manuscript
submissions:

31 October 2024

Message from the Guest Editor

Nanocatalytic materials have recently made great progress in environmental applications and energy technologies. Great efforts have been made by researchers and scientists to create novel nanocatalysts with interesting properties for catalytic applications in energy and the environment.

This Special Issue focuses on the state-of-the-art routes for nanostructure design and detailed characterization techniques for the comprehensive understanding of the nanostructured materials' behavior and their future perspectives in the environmental research field. Here, we invite the scientific community to contribute in the form of original research or review articles that explore the optimized design, study, understanding, and optimization of materials with application in the environment.
