## Asymmetric Catalysis in Organic Synthesis

Guest Editors:

## Prof. Dr. Ashraf Ghanem

Chirality Group, Biomedical Science Program, School of Science, Faculty of Science and Technology, University of Canberra, Canberra, ACT 2601, Australia

## **Dr. Frady Gouany**

Biomedical Science Department, Faculty of ESTeM, Room 27B18, University of Canberra, Canberra, Bruce, ACT 2601, Australia

Deadline for manuscript submissions: closed (31 December 2018)

## Message from the Guest Editors

Asymmetric catalysis (also known as enantioselective catalysis) is considered as one of the ultimate solutions for gaining access to enantiomerically enriched/pure compounds, in which a metal complex carrying chiral ligands has its own merits to return many equivalents of the desired enantiomerically-enriched chiral product. Due to the increasing number of available methodologies to enantiomerically-enriched/pure access organic compounds, the scope of asymmetric catalysis has greatly expanded to include a broad range of chemical transformations. Ideally, a practical asymmetric catalyst should provide high yield and selectivity (chemo-, diastereo- and enantioselectivity) for a broad range of substrates in different reaction conditions, whilst being inexpensive and readily available in both enantiopure forms. A large number of complexes have been already reported, and many of these complexes have been studied and used in asymmetric catalysis.
