Chemical Engineering, South
China University of Technology,
Guangzhou, China

Message from the Guest Editors

The aim of this Special Issue is to cover recent research progress in the fields of electro-oxidation of alcohols including but not limited to methanol and ethanol, especially research effort in fundamental understanding the effects of the atomic structures of the catalysts on the reactivity, selectivity and durability of the electro-catalytic processes using advanced theoretical and experimental approaches. The research results on the electro-catalytic process for the production of both electricity and chemicals are also welcome for submission.
