

Special Issue

Hybrid Nanozymes: From Concept to Biomedical Applications

Message from the Guest Editor

Nanozymes are an array of novel nanomaterials with catalytic activity and enzymatic reaction kinetics. Since their discovery, their remarkable properties have attracted attention. Compared with natural enzymes, they possess many advantages, such as inherent nanomaterial characteristics, a high catalytic stability, a low cost, feasible mass production, and robustness to harsh environments. At present, the major challenge in the practical implementation of nanozymes resides in their limited types and poor substrate selectivity; therefore, intensive efforts have been devoted to the rational design and engineering of hybrid nanozymes. For example, the catalytic performance of nanozymes can be modified by adjusting their size, shape, composition, and structure; a multifunctional catalytic system can be obtained through hierarchical structure design and and/or multi-component fabrication. Coupling with biological molecules can improve biocompatibility and achieve novel properties. In this Special Issue, we would like to collect publications describing the concepts, catalytic mechanisms, and applications of hybrid nanozymes with a hierarchical structure and/or multiple components.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Keith Hohn

Carl R. Ice College of Engineering, Kansas State University, Manhattan,
KS, USA

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, CAB Abstracts, and other databases.

Journal Rank:

JCR - Q2 (Chemistry, Physical) / CiteScore - Q1 (General Environmental Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.6 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
