New Trends in Photocatalytic Applications with Alkaline Earth Metal Titanates

Message from the Guest Editors

Heterogeneous photocatalysis is a promising method to treat a wide variety of environmental pollutants. It is an extensively investigated research area; moreover, semiconductor oxides already have industrial applications. Alkaline earth metal titanates, a novel group of semiconductors, have attractive application prospects due to their unique properties, making them suitable for pollutant degradation, CO₂ reduction, H₂ generation, energy storage, and fuel cells, just to name a few. However, there are still many unanswered questions regarding the causal relationship between their structural and photocatalytic properties. This Special Issue aims to collect papers concerning the design, synthesis, and characterization of alkaline earth metal titanates, as well as focus on their applicability. I am pleased to invite you to submit manuscripts for this Special Issue on “New Trends in Photocatalytic Applications with Alkaline Earth Metal Titanates” in *Catalysts*.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Keith Hohn
Carl R. Ice College of Engineering, Kansas State University, Manhattan,
KS, USA

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), Inspec, Ei Compendex, CAPlus / SciFinder, CAB Abstracts, and other databases.

Journal Rank:

JCR - Q2 (Chemistry, Physical) / CiteScore - Q1 (General Environmental Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.6 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
