Deadline for manuscript submissions:

closed (5 August 2022)

Message from the Guest Editors

Allergic diseases have a high prevalence in the population, and this is truer for the pediatric population. They can occur from very early childhood. They can remain stable until adulthood, or evolve into other forms, as occurs in the so-called "atopic march".

In recent years, the treatment of allergic diseases—and in particular of more complicated conditions, such as severe asthma or severe atopic dermatitis—has been revolutionized by new therapies, largely based on biologics, initially used for the treatment of adult patients and then progressively used successfully also in pediatrics.

In this Special Issue of *Children*, we would like to offer the opportunity to share the latest advances in the field of allergic diseases in childhood, with a special focus on type 2 inflammation

We welcome reviews and original research considering novel approaches, as well as identifying gaps in knowledge. We also encourage submissions that explore how quality of life is affected by these conditions, or how the COVID-19 pandemic has impacted the organization of allergy care and the treatment of allergic children. We look forward to receiving your contributions.
