Message from the Guest Editor

Neurological problems in children are a source of great concern and anxiety to parents and caregivers. Fortunately, there have been rapid developments in our understanding of genetics which have led to the ability to define the genetic and molecular basis of many neurological disorders in children—in some cases, allowing the practice of precision medicine in areas of developmental delay, epilepsy, metabolic disorders, stroke, and neuromuscular disorders. We must keep abreast of these advances so as to care most appropriately for our patients. In addition, there have been tremendous advances in our understanding of neuroimmunology as well, which has led to much better diagnostics and therapeutics in these patients and improvements in our ability to treat disorders that were previously unrecognized.

I look forward to receiving your contributions.
