submissions:

closed (1 March 2021)

Message from the Guest Editors

Childhood it is all about change. To understand how to seize the opportunities that change offers for the development of children's motor performance, with a lifelong impact, has long been a goal of sports science researchers. In this context, science has progressed a great deal in the last several decades. However, we are also keener to understand the problems and limitations that children, particularly some children, face in their development path.

The goal of this Special Issue of *Children* is to highlight recent advances in sports sciences related to this amazing period of childhood. The intended scope of the Special Issue is broad enough to accommodate different areas of expertise and research, as long as they share this common interest in advancing our knowledge on the mechanisms, pathways, and correlates of motor behavior during childhood. We welcome reviews and original research papers, as well as manuscripts identifying gaps in knowledge. We also encourage submissions that explore social and cultural factors, clinical experiences, pedagogical approaches, and methodological essays on the theme.
