Neurobiological and Genetic/Epigenetic Correlates of Eating Disorders in Childhood and Adolescence

Message from the Guest Editor

Eating disorders, encompassing conditions like avoidant/restrictive food intake disorder, anorexia nervosa, bulimia nervosa, and binge-eating disorder, are complex psychological conditions with significant physical health implications. They are influenced by a myriad of factors, including genetic predisposition, neurobiological changes, and environmental triggers. Recent research has started to unravel the genetic and epigenetic underpinnings of these disorders, as well as their relationship with neurobiological changes in childhood and adolescence. This Special Issue seeks to compile and expand the current knowledge on: The genetic and epigenetic factors contributing to the onset and development of eating disorders.

Neurobiological changes associated with eating disorders in childhood and adolescence.

The interaction between genetic, neurobiological, and environmental factors in eating disorders.

Longitudinal studies tracing the progression of these disorders across different life stages.

Implications of these findings for prevention, intervention, and treatment strategies.

About the Journal

Message from the Editor-in-Chief

You are invited to contribute a research article or comprehensive review for consideration and publication in *Children* (ISSN 2227-9067). *Children* is an open access journal—research articles, reviews, and other content are published online immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. The journal focuses on sharing clinical, epidemiological, and translational science relevant to children's health. We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. Paul R. Carney
Departments of Child Health and Neurology, University of Missouri, 400
Keene Street, Columbia, MO 65211, USA
