Neurodevelopmental Disabilities in Neonates

Message from the Guest Editor

Large population-based studies reporting on the fate of prematurely born children have mainly focused on children born extremely preterm and less on children born very or moderately preterm. Premature birth is associated with a significantly increased risk of infantile and adolescent psychopathology, with social adjustment disorders, compared to full-term birth. These social adjustment disorders are correlated with language disorders and/or dysexecutive syndrome and/or behavioral disorders. Thus, neurobehavioral disorders currently dominate the fate of long-term prematurity. Relative to our understanding of the motor and cognitive outcomes, robust conclusions regarding the true nature of childhood psychopathology remain a major challenge, spanning from subclinical to clinical presentations. The aim of this review is to provide a complete characterization of the neurobehavioral phenotype and to highlight the main gaps in knowledge, mainly with regard to the evolution of symptoms, the co-occurrence of disorders, and associations with chronological age and degree of prematurity.

About the Journal

Message from the Editor-in-Chief

You are invited to contribute a research article or comprehensive review for consideration and publication in *Children* (ISSN 2227-9067). *Children* is an open access journal—research articles, reviews, and other content are published online immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. The journal focuses on sharing clinical, epidemiological, and translational science relevant to children's health. We would be pleased to welcome you as one of our authors.

Editor-in-Chief
