Treatment Strategies for Hearing Loss in Children

Message from the Guest Editor

Globally, hearing loss is common in children and represents one of the most frequent congenital diseases in the pediatric population. It has been widely demonstrated that without hearing rehabilitation, hearing loss can cause detrimental effects on language, developmental, and cognitive outcomes. In the last few years, there has been great progress in the diagnosis and management of these cases. Treatment strategies include hearing device options, cochlear implant and assistive devices. Hearing aid usage in young children remains challenging for both parents and audiologists. The introduction of cochlear implants has greatly changed life conditions for these children. However, outcomes are not always predictable, depending on each child and also on the family. We encourage the submission of papers that broaden our knowledge on this topic.

About the Journal

Message from the Editor-in-Chief

You are invited to contribute a research article or comprehensive review for consideration and publication in *Children* (ISSN 2227-9067). *Children* is an open access journal—research articles, reviews, and other content are published online immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. The journal focuses on sharing clinical, epidemiological, and translational science relevant to children's health. We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. Paul R. Carney
Departments of Child Health and Neurology, University of Missouri, 400
