Kawasaki Disease in Children and Adolescents

Message from the Guest Editor

Kawasaki disease was once a rare diagnosis, but now it is increasingly common. The recent British Paediatric Surveillance Unit study showed that there were 19% of children with coronary artery aneurysms as a consequence. It also showed that the incidence is increasing and globally, we find that the incidence is doubling every 10 years. These may have life-long effect on the developing child. Those most likely to develop such aneurysms live in rural areas, and have fewest of the associated clinical features, are diagnosed late and treated late as a consequence. Sadly, many clinicians in the Western world believe that this condition is too rare to be seen on the wards. We hope that this Special Issue will highlight the areas of concern, those where there is lack of knowledge and those where there is more work to be undertaken, raising awareness as a consequence for the benefit of future children.

- Kawasaki Disease
- Coronary artery aneurysm
- Intravenous immunoglobulin
- Infants
- Adolescents
- Coronary artery disease

About the Journal

Message from the Editor-in-Chief

You are invited to contribute a research article or comprehensive review for consideration and publication in *Children* (ISSN 2227-9067). *Children* is an open access journal—research articles, reviews, and other content are published online immediately after acceptance. The scientific community and the general public have unlimited free access to the content as soon as it is published. The journal focuses on sharing clinical, epidemiological, and translational science relevant to children's health. We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. Paul R. Carney
Departments of Child Health and Neurology, University of Missouri, 400
