Exosomes in Cancers

Message from the Guest Editor

Previously considered trash particles, exosomes (30–150 nm extracellular vesicles) play an important role in cancer development and progression. The function of these tiny vesicles depends on their origin. All body cells produce exosomes, and they are present in every bodily fluid. Because exosomes play a crucial role in cancer progression, we would like to invite the submission of manuscripts for this Special Issue entitled “Exomes in Cancer”. We intend to focus on the role of exosomes in cancer progression in this Special Issue. There will be a variety of topics discussed in this Issue, including exosomes activating or inhibiting signaling pathways, immune suppression by exosomes, the role of exosomes in angiogenesis, the role of exosomes in reprogramming the tumor microenvironment, and their role in tumor cell immune escape regulation. In addition, manuscripts that examine the application of exosomes to cancer treatment, either in conjunction with nanoengineered drugs or chemotherapeutics, are welcome.

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PMC,
PubMed, Embase, CAPus / SciFinder, FSTA, AGRIS, and
other databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 17.8 days after
submission; acceptance to publication is undertaken in 2.7
days (median values for papers published in this journal in
the first half of 2025).

Recognition of Reviewers:

APC discount vouchers, optional signed peer review, and
reviewer names are published annually in the journal.
