Message from the Guest Editors

Tropical cyclone intensity, rainfall, and larger storm surges are likely to increase as a result of global climate change, and they may intensify more rapidly and occur at higher latitudes. These results may be driven by rising sea temperatures and increased maximum water vapor content in the atmosphere as the air heats up. This Special Issue will focus on:

Deadline for manuscript
submissions:

closed (30 November 2023)

- Assessment of the effect of climate change on tropical cyclone activity, including intensity, rainfall, and coastal flood risk;
- Seasonal to sub-seasonal tropical cyclone predictions and future tropical cyclone probabilistic forecasts;
- Climatological dataset analysis and uncertainty for intensity trend detection and control of tropical cyclones' natural variabilities.

This Special Issue will provide the larger research community with a platform to share the most current advancements in these fields regarding climate change aspects of global or regional TC activity. Both fresh observational and modeling-based research are encouraged in this Special Issue.
