Special Issue

Assessment of Climate Change Impacts on Water Quantity and Quality at Small Scale Watersheds

Message from the Guest Editors

This Special Issue was inspired by the Hydrology–H030 Session of the 2019 AGU (America Geophysical Union) Fall Meeting. In recent years, simulating potential future vulnerability and sustainability of water resources due to climate change have mainly been focused on global and regional scale watersheds using climate change scenarios. These scenarios may have low resolution and may not be accurate for local watersheds. This topic addresses the impacts of climate change upon water quantity and quality at small-scale watersheds. Emphases are on climate-induced water resource vulnerabilities (e.g., flood, drought, groundwater depletion, evapotranspiration, and water pollution) and methodologies (e.g., computer modeling, field measurement, and management practice) employed to mitigation and adapt climate change impacts on water resources. Application implications to local water resource management should also be discussed in the papers. Keywords:

- Adaption and mitigation
- Climate-induced impact
- Hydrological process
- Small scale watershed
- Water quality
- Water resource management

Author Benefits

High Visibility:

indexed within Scopus, ESCI (Web of Science), GeoRef, AGRIS, and other databases.

Journal Rank:

JCR - Q2 (Meteorology and Atmospheric Sciences) / CiteScore - Q2 (Atmospheric Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 21.6 days after submission; acceptance to publication is undertaken in 3.9 days (median values for papers published in this journal in the first half of 2025).
