Effects of Pre-Sleep Artificial Light on Cognition and Sleep

Message from the Guest Editor

Artificial light is a phylogenetically new development in the human history. Allowing us to see and be productive during the night hours, it has caused the boundaries between day and night to blur. Not very surprisingly, it thereby also affects sleep and is likely to also alter sleep-associated processes such as memory consolidation. The aim of this Special Issue is to cover the effects of pre-sleep artificial light exposure on sleep, circadian rhythms, cognitive performance, and sleep-associated processes in humans and animals—and how light exposure may be modulated to benefit sleep, for example, in shift workers.

Author Benefits

High visibility:

indexed within Scopus, ESCI (Web of Science), PubMed,
PMC, FSTA, and other databases.

Journal Rank:

CiteScore - Q2 (Neuroscience (miscellaneous))

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 27.8 days after
submission; acceptance to publication is undertaken in 3.6
days (median values for papers published in this journal in
the second half of 2025).
