Message from the Guest Editors

Dear Colleagues,

For the longest time, the management of gynecologic malignancies was very streamlined, with few options and mediocre outcomes, especially for those with advanced or recurrent disease. In the recent past, however, there has been a rapid advancement in care, including methods of surgical access to the malignancy, molecular diagnosis, and classification of disease, personal medicine therapeutic options and methods of radiation therapy, and combinations thereof. We invite researchers to address one of these topics related to malignancies of the ovary/fallopian tube, uterus, cervix/vagina/vulvar (lower genital tract), or gestational trophoblastic neoplasm.
