Message from the Guest Editor

Dear Colleagues,

Chemotherapy and hormonal therapy have been the cornerstone of systemic therapy for cancer patients for the past 70 years, while, more recently, targeted therapy, monoclonal antibody therapy, and immunotherapy have seen significant increases in use. Given the increasing incidence of cancer, the changing age demographics of the affected population, the increased indications for therapies in earlier stages of disease, and the increased efficacy of recent therapies, there is a growing number of long-term survivors who have been treated with systemic chemotherapy, immunotherapy, hormonal therapy, and targeted therapy. This Special Issue focuses on the long-term effects of these therapies that require special attention in cancer survivors.
