Message from the Guest Editors

Dear colleagues,

The number of older adults with cancer has grown significantly and, due to the aging population, will significantly increase further. Older adults have been underrepresented in clinical research, and this has resulted in less evidence on how to best treat and care for this population. For this Special Issue, we welcome any manuscript focusing on new research focusing on basic, clinical, and psychosocial research focusing on older adults with cancer and their caregiver. This Special Issue aims to summarize the latest evidence on providing care to this population.
