Clinical Management of Lung Cancer Brain Metastases

Message from the Guest Editor

Brain metastases represent one of the most challenging complications of lung cancer, significantly contributing to morbidity and mortality. Current clinical management strategies include surgery, radiotherapy, systemic therapy, and newer targeted and immunotherapeutic approaches. Each of these modalities, however, has important limitations. In this Special Issue, we invite original research articles and reviews addressing the clinical management of lung cancer brain metastases. Contributions focusing on novel therapeutic approaches, mechanisms of resistance, prognostic and predictive factors, and multidisciplinary strategies are particularly encouraged. Through this Special Issue, we will foster new insights into treatment modalities and prognostic models that will enhance the care of patients with this complex and evolving condition.
