Message from the Guest Editor

In recent years Positron Emission Tomography (PET) have changed clinical and scientific scenarios in several diagnostic areas, such as oncology, neurology, endocrinology, internal medicine, and cardiology. Hybrid imaging such as PET/CT or PET/MR have helped to merge functional and morphological information. Other than 18F-Fluorodeoxyglucose (18F-FDG), several other tracers have been studied and used in clinical practice.

More recently, Artificial Intelligence applications have been proposed in several context of PET imaging, such as acquisition, reconstruction, lesion recognition, contouring, radiomics, data analysis, and management, to further help clinicians for scientific purpose or in daily routine.

In the Special Issue called "Artificial Intelligence for advanced analysis in PET imaging", we invite all original or review papers, letters, and commentaries about this topic, with no limitations about clinical or technical context.

Applications by senior/young authors, large cohorts or pilot studies are appreciated.

Message from the Editor-in-Chief

You are cordially invited to submit research articles, short communications, comprehensive reviews, case reports or interesting images for consideration and publication in *Diagnostics* (ISSN 2075-4418). *Diagnostics* is published in open access format – research articles, reviews and other contents are released on the Internet immediately after acceptance. The scientific community and the general public have unlimited and free access to the content as soon as it is published. We would be pleased to welcome you as one of our authors.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, Inspec, CAPlus / SciFinder, and other databases.

Journal Rank: JCR - Q1 (Medicine, General and Internal) / CiteScore - Q2 (Internal Medicine)
