

Special Issue

Computational Intelligence and Load Forecasting in Power Systems

Message from the Guest Editor

Load forecasting is a key tool in the design of the electricity system. It refers to the process of predicting the amount of demand for electricity in an area and/or a transmission network over a period of time. The forecasting aims to determine the amount of electricity in a future time horizon. Load forecasting may correspond to a prediction of total energy, hourly load, peak load and load duration curve. Load forecasting explores issues such as the demand for installed capacity to meet potential demand growth, the type of energy resources to be used, the development of the transmission and distribution systems, the demand by type of consumer and by geographical area in order to implement demand side management measures and others. Since power systems are gradually transforming to smart grids, new issues arise that can be addressed with robust forecasting algorithms. Also, the deregulation of electricity markets provide new opportunities for many market participants. Forecasting can aid to the strategic actions of market players to minimize risks and increase profits.

About the Journal

Message from the Editor-in-Chief

Energies is an international, open access journal in energy engineering and research. The journal publishes original papers, review articles, technical notes, and letters. Authors are encouraged to submit manuscripts which bridge the gaps between research, development and implementation. The journal provides a forum for information on research, innovation, and demonstration in the areas of energy conversion and conservation, the optimal use of energy resources, optimization of energy processes, mitigation of environmental pollutants, and sustainable energy systems.

Editor-in-Chief

Prof. Dr. Enrico Sciubba
Department of Mechanical and Industrial Engineering, University
Niccolò Cusano, 00166 Roma, Italy

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), Ei Compendex, RePEc, Inspec, CAPlus / SciFinder, and other databases.

Journal Rank:

CiteScore - Q1 (Control and Optimization)
