New Advances in High-Entropy Alloys

Message from the Guest Editor

Dear Colleagues,

High-entropy alloys (HEAs) are alloys with high-entropy of configuration in the liquid state, this high-entropy intend to make the disordered phases stable, such as random solid solution or amorphous phases. The first generation of HEAs is defined as alloys with more than five components with an equiatomic ratio and single phase, which include face centered cubic (FCC), body centered cubic (BCC), hexagonal close packed (HCP), and amorphous structured HEAs. The recent advances in HEAs mainly focus on the second generation of HEAs, e.g., the non-equatomic ratio and dual phase HEAs, which include four kinds of HEAs: (1) eutectic HEAs, which have excellent casting properties; (2) precipitation hardening HEAs, which is potentially the next generation of superalloys; (3) phase transformation induced plasticity (TRIP) HEAs; and (4) ultrafine grain HEAs. HEAs potentially break the property limits of the traditional alloys.

This Special Issue specifically emphasizes research that addresses phase formation and alloys design, serration and noise behaviors, large fluctuation and collective phenomena, plastic flow, and flow units. We encourage submissions of the high-entropy films, high-entropy ceramics, etc.

The concept of entropy is traditionally a quantity in physics that has to do with temperature. However, it is now clear that entropy is deeply related to information theory and the process of inference. As such, entropic techniques have found broad application in the sciences.

*Entropy* is an online open access journal providing an advanced forum for the development and/or application of entropic and information-theoretic studies in a wide variety of applications. *Entropy* is inviting innovative and insightful contributions. Please consider *Entropy* as an exceptional home for your manuscript.

Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High visibility:** indexed by the Science Citation Index Expanded (Web of Science), MathSciNet (AMS), Inspec (IET), Scopus and other databases.

**Rapid publication:** manuscripts are peer-reviewed and a first decision provided to authors approximately 19.1 days after submission; acceptance to publication is undertaken in 5 days (median values for papers published in this journal in the second half of 2018).
