

Special Issue

Multimedia Data Security and Privacy Protection Based on Chaotic Systems and Compressive Sensing

Message from the Guest Editors

Currently, chaos theory and compressive sensing technology both play a significant role in enhancing data security. The research on chaotic system modeling and its entropy analysis, compressed sampling technology, and its security application is increasing. In addition, the research in this area needs further exploration and innovation. Meanwhile, it is necessary to combine new computer technology and artificial intelligence methods to explore new methods for the security application of chaotic systems and compressive sensing. We very much welcome contributions centered around solving these problems.

This Special Issue aims to become a forum to introduce new and improved technologies of chaotic system modeling, entropy analysis, and compressed sampling. In particular, with the help of chaotic systems and compressive sensing, combined with new computer technology and artificial intelligence methods, proposing new multimedia data encryption and privacy protection schemes fall within the scope of this Special Issue.

About the Journal

Message from the Editor-in-Chief

The concept of entropy is traditionally a quantity in physics that has to do with temperature. However, it is now clear that entropy is deeply related to information theory and the process of inference. As such, entropic techniques have found broad application in the sciences.

Entropy is an online open access journal providing an advanced forum for the development and/or application of entropic and information-theoretic studies in a wide variety of applications. *Entropy* is inviting innovative and insightful contributions. Please consider *Entropy* as an exceptional home for your manuscript.

Editor-in-Chief
