Special Issue

From Time Series to Stochastic Dynamic Models

Message from the Guest Editors

When dynamical equations describing a complex system are not known, as, e.g., for many systems considered in real world, we need a top-down approach to understand its complexity and modeling. We welcome contributions that have focus on the question in the field of complex systems: Given a fluctuating (in time or space), uni- or multi-variant sequentially measured set of experimental data, with a data-based approach how should one analyze the data, assess underlying deterministic trends and nonlinearities, uncover characteristics of the fluctuations and construct a stochastic evolution equation? The answer to this question yields important information on the dynamical properties of the system under consideration. Foreseen contributions include the following:

- Construction of a stochastic dynamical equation from time series
- Data-based construction of a potential function from time series, whose valleys represent stable attractors of the dynamics
- Characterizations of local (time-dependent) stochastic behaviors of a given nonstationary time series

About the Journal

Message from the Editor-in-Chief

The concept of entropy is traditionally a quantity in physics that has to do with temperature. However, it is now clear that entropy is deeply related to information theory and the process of inference. As such, entropic techniques have found broad application in the sciences.

Entropy is an online open access journal providing an advanced forum for the development and/or application of entropic and information-theoretic studies in a wide variety of applications. *Entropy* is inviting innovative and insightful contributions. Please consider *Entropy* as an exceptional home for your manuscript.
