

Special Issue

Recent Developments in Flame Retardant Materials

Message from the Guest Editors

The inherent flammability of combustible materials, which have been widely used in construction, transportation, and household products, poses a significant threat to our society. The incorporation of flame retardants to these combustible solids provides an effective solution to this problem. Currently, various flame retardant formulations are being developed and used in clothing, firefighting, military defense, petrochemicals and other fields, including phosphorus, nitrogen, silicon, boron and metal hydroxide-containing flame retardant materials. In this Special Issue, both original articles and reviews are welcome. Topics of interest for publication include, but are not limited to:

- Flame retardant materials design and development;
- Material flammability and flame retardancy;
- Pyrolysis and flame spread modeling of flame retardant materials;
- Flame retardant coating;
- Future perspectives for flame retardant materials/polymers;
- Research techniques that combine experiments and numerical modeling.

About the Journal

Message from the Editor-in-Chief

Fire is an international open-access journal about the science, policy, and technology of fires and how they interact with communities and the environment. *Fire* seeks to provide a forum to help the fire science community convey how we can live with fire in a changing world. *Fire* seeks submissions from interdisciplinary studies that take a pyrogeography perspective of fires occurring in natural, cultural, and industrial landscapes and how they interact with communities in the science-policy interface. *Fire's* Editorial Board are widely recognized international leaders. The journal emphasizes quality and innovation and has a rigorous peer-review process. I strongly recommend *Fire* for the rapid publication of your innovative research publications and case studies.
