

Special Issue

Multiphase Flow in Pipes with and without Porous Media, Volume II

Message from the Guest Editor

Multiphase flow (with/without heat transfer) is a common flow type in boilers in both conventional and nuclear power plants, petroleum pipelines, heat exchanger systems, biological systems, the food industry, and most chemical processes. The multiphase complexity lies in its transient nature and its frequent and unpredictable transitions between various types of flow patterns, such as bubbly, stratified smooth, stratified wavy, plug, semi-plug, annular, etc. This Special Issue of multiphase flow is devoted to recent advances in experimental measurements, new measuring techniques, and computational modeling of flow in pipes with and without porous media. Papers on induced turbulence due to multiphase flow are also considered.

About the Journal

Message from the Editor-in-Chief

Fluids (ISSN 2311-5521) is an international journal on all aspects of fluids in open access format: research articles, reviews and other contents are released on the internet immediately after acceptance. You are invited to contribute a research article or a comprehensive review for consideration and publication in *Fluids*. The scientific community and the general public have unlimited free access to the content as soon as it is published. Please consider *Fluids* as an exceptional, exciting enterprise ready to reward your trust, attention, and active participation.

Editor-in-Chief

Prof. Dr. D. Andrew S. Rees

Department of Mechanical Engineering, University of Bath, Bath BA2 7AY, UK

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, ESCI (Web of Science), Inspec, CAPIus / SciFinder, and other databases.

Journal Rank:

CiteScore - Q2 (Mechanical Engineering)
