

Special Issue

Energy Crops for Biofuel Production

Message from the Guest Editor

It is expected that biomass will have the greatest contribution in achieving the growth in the biofuel production sector, by introducing energy crops in the supply chain itself. Low requirements for fertilization and minimum application of herbicides makes energy crops environmentally friendly, but can also ensure the sustainability of the biomass supply, whilst using marginal lands for their growth. This makes both, fuel output and climate benefits per unit of land as important parameters, and as such, life-cycle assessment is used to identify the aspects of the most important environmental impacts. Therefore, authors are invited to contribute to the potential topics of this Special issue, which include, but are not limited to, growing novel energy crops for biofuel production, analysis of biomass quality, biogas/ethanol production development processes, and advanced biofuels' production.

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid
by authors or their institutions.

High Visibility:

indexed within ESCI (Web of Science), EBSCO, Ei
Compendex, and other databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 24.7 days after
submission; acceptance to publication is undertaken in 8.8
days (median values for papers published in this journal in
the first half of 2025).
