Message from the Guest Editors

Dear Colleagues,

An important open question today is the understanding of the relevance that dark matter (DM) halo substructure may have for DM searches. In the standard cosmological framework, subhalos are predicted to be largely abundant inside larger halos.

With this Special Issue we aim to summarize where we stand today on our knowledge of the different

- Formation and evolution of halo substructure: merging and accretion, survival and disruption.
- Structural properties of subhalos. Subhalo DM density profiles, concentrations.
- N-body cosmological simulations as a tool for understanding halo substructure.
- Observations of dwarfs galaxies in the Milky Way. Current and upcoming surveys (DES, LSST...).
- Indirect detection of DM in dwarf galaxies.
- Search for "dark satellites". Unidentified gamma-ray sources.
- Substructure boosts to DM annihilation signals.
- Lensing as a probe of halo substructure.
- Stellar gaps in stellar streams induced by DM subhalos.

Message from the Editor-in-Chief

Galaxies provides an advanced forum for studies related to astronomy, astrophysics, and cosmology, including all of their subfields. Different formats, such as specialized research articles, reviews, communications and technical notes are welcomed. Manuscripts containing original and creative research proposals and ideas are especially appreciated.

We encourage scientists to publish their astronomical observations and theoretical results in as much detail as possible. There is no restriction on the paper length and full experimental and methodological details, as applicable, should be provided. All papers will be peer reviewed promptly. On behalf of the distinguished members of the editorial board, I extend my welcome to all researchers working on these subjects to contribute to *Galaxies*.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: Indexed in the Emerging Sources Citation Index (ESCI) - Web of Science, in Scopus (from Vol. 1), Inspec (IET), as well as in ADS - Astrophysics Data System.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 25.4 days after submission; acceptance to publication is undertaken in 3.9 days (median values for papers published in this journal in the second half of 2019).
