Laboratory Experimental Testing of Political Science Models

Message from the Guest Editor

Laboratory experiments allow for the testing of decision making models by making it possible to observe human behavior within a controlled environment where a model's variables can be isolated and measured. This method is particularly useful to generate data for models that take an axiomatic approach since in many instances no relevant field data are available to test the parameters of the model. In economics this method to produce data testing axiomatic models has approached mainstream status as evident by the latest two Nobel laureates in economics, Elinor Ostrom and Alvin Roth, who both used laboratory experiments in their research. This special issue explores laboratory experiments that examine political science models. These articles show the importance of this methodology in providing data and useful insights for political science questions.

Stavanger, Norway

Author Benefits

High Visibility:

indexed within Scopus, ESCI (Web of Science),
MathSciNet, zbMATH, RePEc, EconLit, EconBiz, and other
databases.

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 32.6 days after
submission; acceptance to publication is undertaken in 6.9
days (median values for papers published in this journal in
the first half of 2025).

Recognition of Reviewers:

reviewers who provide timely, thorough peer-review
reports receive vouchers entitling them to a discount on
the APC of their next publication in any MDPI journal, in
appreciation of the work done.
