Message from the Guest Editors

Dear Colleagues,

Colorectal cancer (CRC) covers at least 10% of human neoplasms detected each year, representing the third most common cancer. Colorectal cancer carcinogenesis plays a pivotal role in defining CRC progression and paves the way for “tailored” therapy.

It is of urgent necessity to identify early diagnosis biomarkers through the identification of new biological and molecular “signatures” and the integration of morphological and immunophenotypical features able to improve the prognosis and efficacy of the therapeutic response.

This Special Issue will also be dedicated to gastroenteropancreatic neuroendocrine neoplasms—a rare and heterogeneous population of tumors whose incidence rate has increased dramatically over the past several years.

We warmly welcome the submission of original research papers and reviews.
