

## Special Issue

# Gel-Based Materials for Biomedical Engineering

### Message from the Guest Editors

Gels, or hydrogels, are colloidal systems composed of two or more phases commonly used in biomedical applications and usually consist of three-dimensional polymer networks and solvents. Due to their inherent biocompatibility, high water content, porosity, flexibility, and low immunogenicity, hydrogels have been widely used in biomedical fields. Examples of its application include contact lenses, biosensors, drug delivery systems, wound healing and tissue engineering. In addition, by modifying the polymer network with stimuli-responsive groups or them compounding with functional components, we can obtain “smart” hydrogels. These are distinguished by their responsiveness to different types of stimuli including thermal, light, magnetic field, chemical reagents, ultrasound and pH. The potential applications of these hydrogels in biomedical engineering need to be further explored. This Special Issue, entitled “Gel-Based Materials for Biomedical Engineering,” aims to further explore the composition, structure, performance and biocompatibility of gels, providing the latest research progress into gel-based materials in biomedical applications.

## About the Journal

### Message from the Editor-in-Chief

*Gels* (ISSN 2310-2861) is recently established international, open access journal on physical and chemical gel-based materials. The journal aim is to encourage scientists to publish their experimental and theoretical results in as much detail as possible. General topics include but not limited to synthesis, characterization and applications of new organogels, hydrogels and ionic gels made either from low molecular weight compounds or polymers, composite and hybrid materials where a metal is by some means incorporated into the gel network, and computational studies of these materials in order to provide a better understanding of gelation mechanism. We cordially invite you to consider publishing with us and contribute with your own grain of sand to the advance in this fascinating field.

### Author Benefits

#### High visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, CAPus / SciFinder, and other databases.

#### Journal Rank:

JCR - Q1 (Polymer Science) / CiteScore - Q1 (Organic Chemistry)

#### Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 12.5 days after submission; acceptance to publication is undertaken in 2.7 days (median values for papers published in this journal in the first half of 2025).
