Message from the Guest Editors

Dear Colleagues,

Our understanding of plant traits and biological mechanisms has been enormously improved over the past decade. Recent plant breeding programs have taken into account available genomic information, e.g., for (1) dissecting the genetic architecture of agronomic traits; (2) unlocking the hidden favorable genetic diversity from genetic resources; or (3) discovering, validating and characterizing economically important genes. Evidence has been accumulating that heritable variation of a trait is not solely determined by DNA sequence polymorphism but involves epigenetic processes that impact chromatin structure and gene expression. Especially, with the rapid development of CRISPR-Cas technology, it is believed that the promise of novel and improved crops with greater yield and tolerance to the stresses of climate change and extreme weather is around the corner. The aim of this issue is to publish original research, review articles addressing recent advances on plant genomics and epigenomics as emerging approaches for plant breeding.

Deadline for manuscript submissions:

closed (30 November 2017)

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or institutions.

High Visibility: indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Embase, PubAg, and other databases.

Journal Rank: JCR - Q2 (*Genetics and Heredity*) / CiteScore - Q2 (*Genetics (clinical)*)

Genes are central to our understanding of biology, and modern advances such as genomics and genome editing have maintained genetics as a vibrant, diverse and fastmoving field. There is a need for good quality, open access journals in this area, and the *Genes* team aims to provide expert manuscript handling, serious peer review, and rapid publication across the whole discipline of genetics. Starting in 2010, the journal is now well

Why not consider *Genes* for your next genetics paper?
