Role of ATM and MRE11 in Genomic Stability and Oxidative Stress Responses

Message from the Guest Editors

Genetic disorders, which are defective in *ATM* or *MRE11*, are categorized in radiation-hypersensitive disease and show similar cellular phenotypes, such as radioresistant DNA synthesis and chromosome instability, as well as radiation hypersensitivity. Many studies in the last few decades, have identified ATM and MRE11 as critical players in the maintenance of genomic stability against various types of DNA damages, including radiation-induced DNA double-strand break (DSB) and replication stress. The *ATM* gene product shows protein kinase activity, which is activated in response to oxidative stress as well as generation of DSB damages. Such an activity upon oxidative stress is suggested to play a role in repressing neurodegeneration. In this Special Issue, we welcome reviews and original articles covering many aspects of the role of ATM, MRE11, and related factors (ATR, NBS1, RAD50, etc.) in maintaining genomic stability or resisting oxidative stress. We also welcome reviews or original articles providing the clues to solve the mechanisms of pathogenesis in these genetic disorders. We look forward to your contribution.

About the Journal

Message from the Editor-in-Chief

Genes is central to our understanding of biology, and modern advances such as genomics and genome editing have maintained genetics as a vibrant, diverse and fast-moving field. There is a need for good quality, open access journals in this area, and the *Genes* team aims to provide expert manuscript handling, serious peer review, and rapid publication across the whole discipline of genetics. Starting in 2010, the journal is now well established and recognised. Why not consider *Genes* for your next genetics paper?

Editor-in-Chief

Prof. Dr. Selvarangan Ponnazhagan
Department of Pathology, The University of Alabama at Birmingham,
1825 University Blvd, SHEL 814, Birmingham, AL 35294-2182, USA

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, MEDLINE, PMC, Embase, PubAg, and other databases.

Journal Rank:

JCR - Q2 (Genetics and Heredity) / CiteScore - Q2 (Genetics (clinical))
