closed (1 April 2022)

Message from the Guest Editors

In order to adapt to aged societies, and to support a greater desire of people to live independently as well as to enable younger generations to maintain their health and active participation in the society when they grow old, we need a significant change in the behaviors and thought processes of healthcare providers, the public, and elderly people's friends and families. This will relate to all aspects of a person's life, including planning, decision making, and day-to-day living. To make super-aged societies sustainable, innovations with digital technologies are necessary to enhance people's happiness and reduce social costs at the same time.

This Special Issue focuses on how to utilize these transformations and innovations to further promote health and better deal with the global aging challenge, and it invites research on, among others, technology development or applications in digital and smart health, empirical analysis of health behavior, and managerial decision problems in digital health. Papers on the considerable research challenges and comprehensive achievements are especially welcome.
