Message from the Guest Editors

Despite recent advances in cancer research such as the introduction of novel antimetabolite drugs and immune checkpoint inhibitors, oncology patients are frequently threatened by complications of cancer such as venous or arterial thrombosis, which could paradoxically be worse in patients receiving cancer treatment. Some types of cancer such as gastrointestinal malignancies, lung cancer, and pancreatic cancer are known for their stronger associations with thrombotic conditions.

This Special Issue will cover recent advances in the knowledge of pathophysiology, prediction, diagnosis, and treatment of thromboembolic complications in patients with cancer in different clinical settings.
