Psychosocial Interventions during Spinal Cord Injury Rehabilitation

Message from the Guest Editors

Spinal cord injury (SCI) is a neurological disorder that leads to the partial or complete loss of motor, sensory, and/or autonomic functions below the level of the injury. Survivors are vulnerable to experiencing various physical and psychosocial complications during their long recovery process. Most SCI survivors experience depression and anxiety caused by the inability to effectively cope with one's disability, loneliness, low self-efficacy, unhealthy behaviors, difficulties in managing social relationships, social isolation, and a lack of support. Psychosocial interventions, which adopt single or combined psychosocial approaches such as cognitive behavioral therapy, mindfulness practice, skill training, psycho-education, supportive intervention, or counseling, are increasingly receiving recognition due to their ability to improve the mental health and overall well-being of individuals with SCI during their long-term rehabilitation. We are pleased to invite you to provide health professionals and researchers with evidence-based recommendations regarding the psychosocial interventions that may be employed during SCI rehabilitation.

About the Journal

Message from the Editor-in-Chief

Healthcare is an international, peerreviewed, open access, multidisciplinary journal. Original research articles, short communications, review articles, and symposium highlights are welcomed.

Healthcare hopes to influence global health and disease aspects, and hopes to gain high visibility and acceptance by the scientific and healthcare community and will dedicate itself to covering special and specific topics in special issues.

We would be pleased to welcome you as one of our authors.

Editor-in-Chief

Prof. Dr. Lorraine S. Evangelista
